

# World Wide Modeling Made Easy

## A Simple, Lightweight Model Server

Olivier Le Goaer & Eric Cariou & Franck Barbier  
University of Pau - Computer Science Lab, France

POWERED BY NODE JS

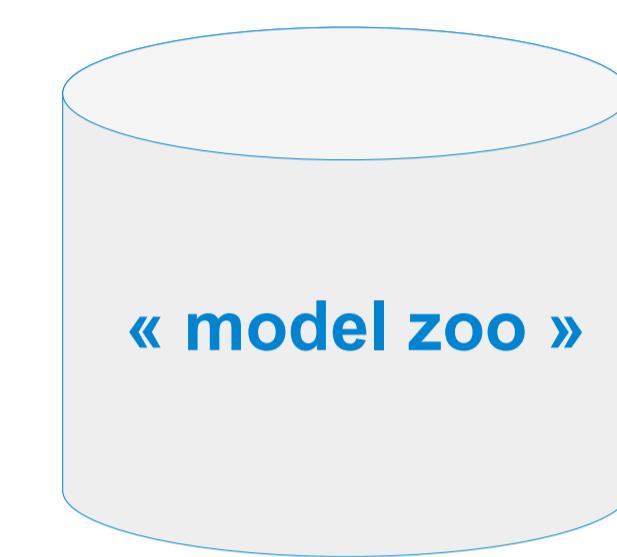

### Problem of interest

« Dear students,  
Today we are going to write a M2M transformation from UML StateCharts to Petri Nets as an EMF project.  
Wait...you will need 3 things:  
1. the UML metamodel (or a subset/fragment)  
2. the Petri Nets metamodel  
3. an input statecharts model to run the transformation  
...  
Good luck »

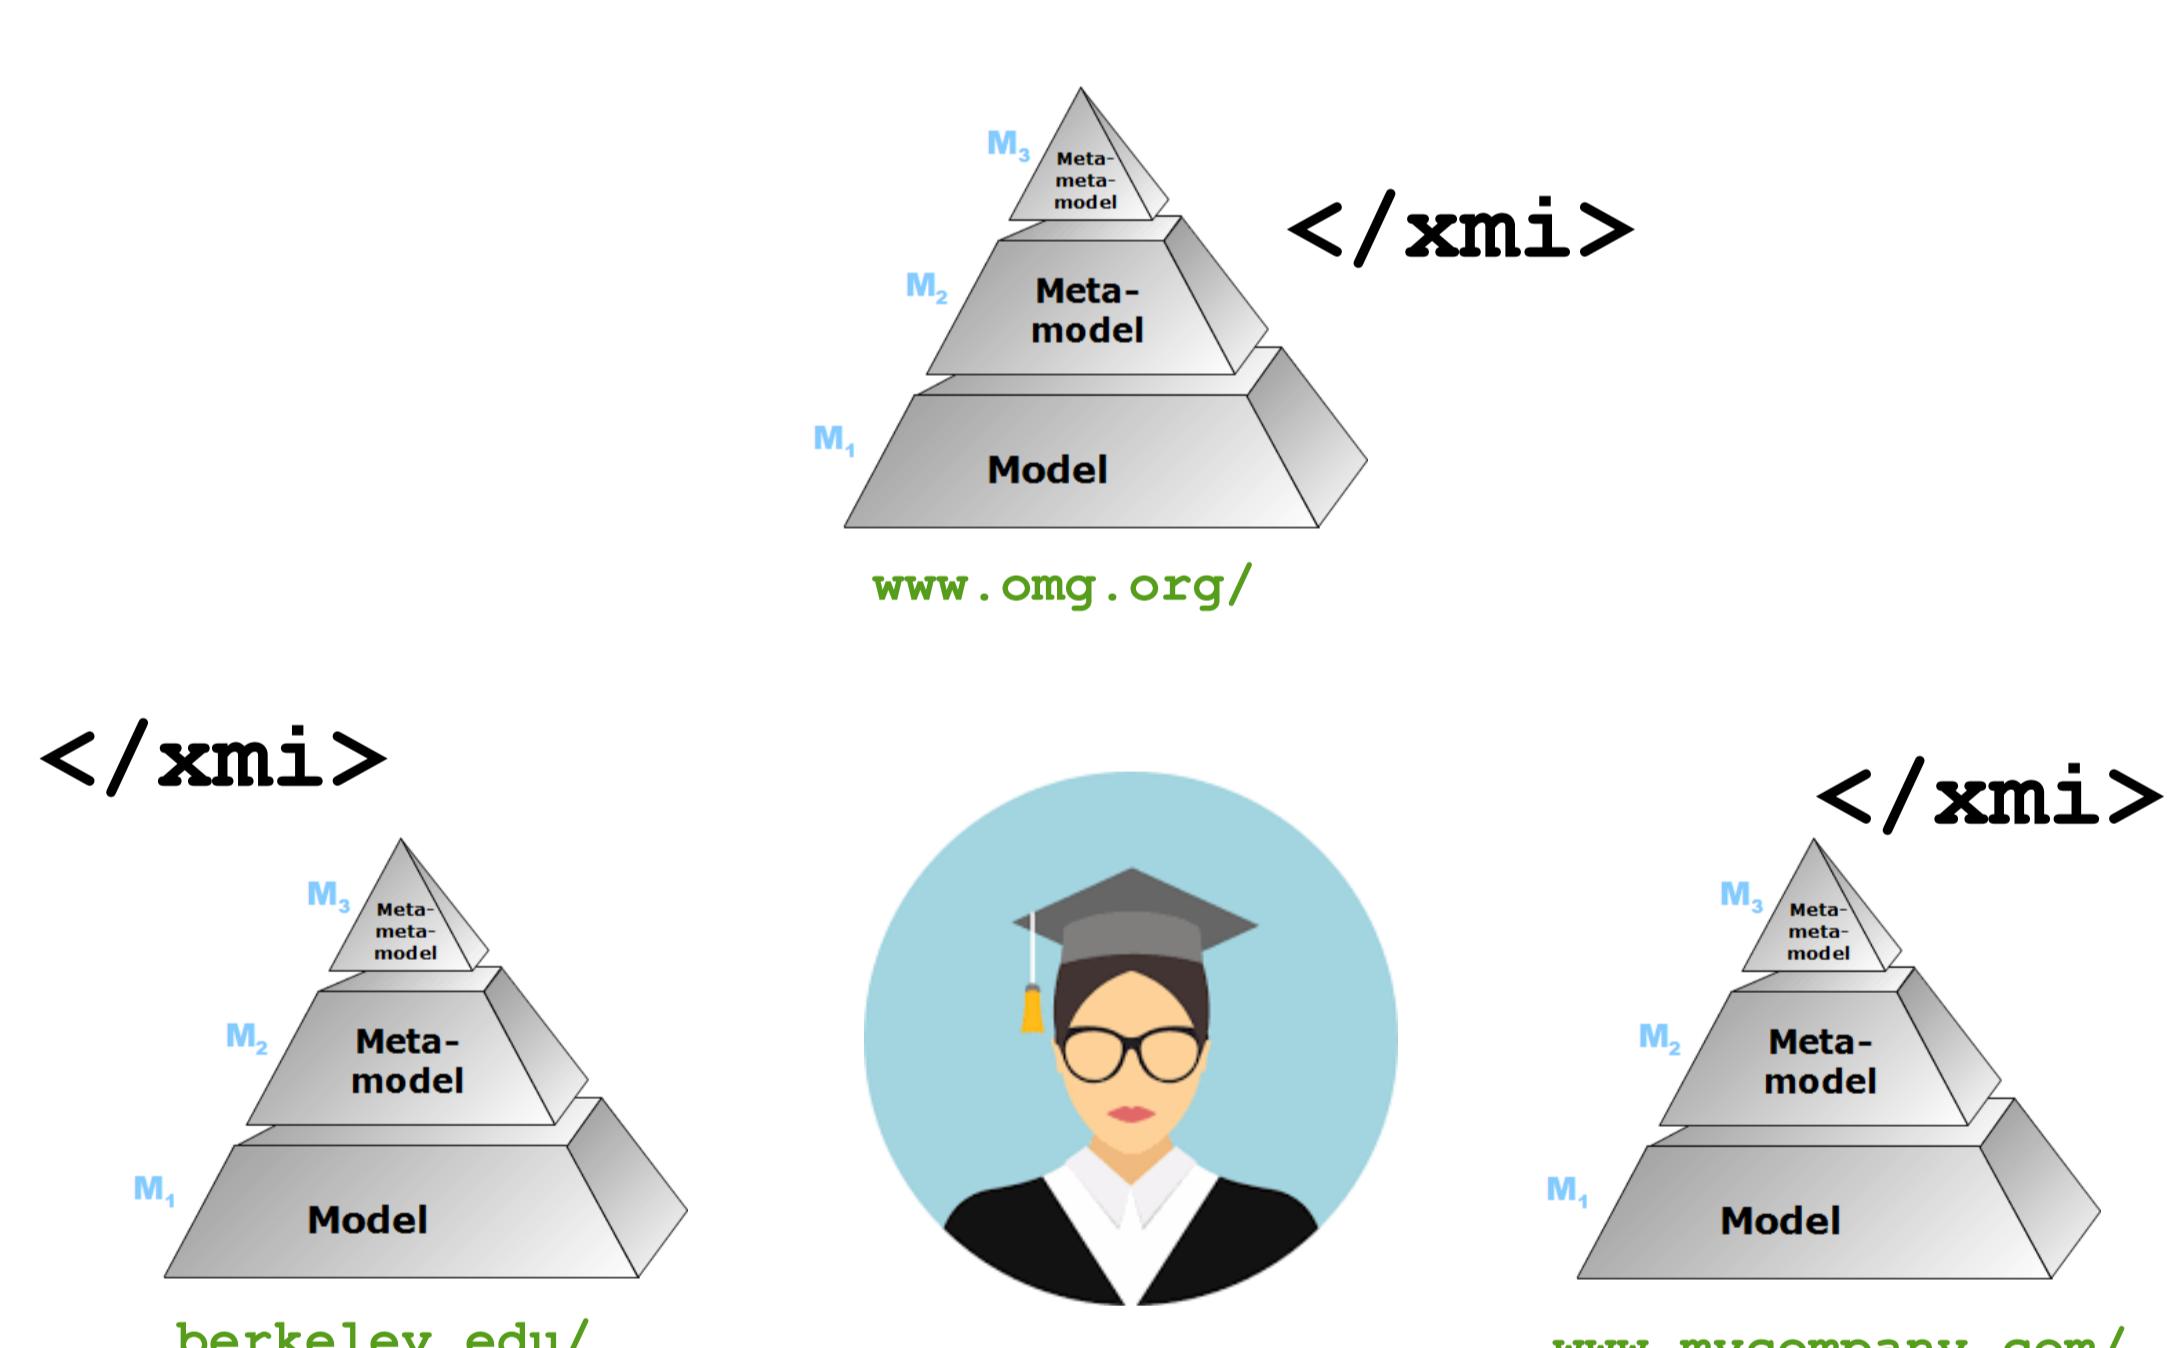

- How modeling assets are shared daily?
- Why models URIs are still not reality?

### Model directories' failure

- Unmaintainable and hence quickly deprecated
- Inevitably incomplete
- Hard to process automatically (website front-end)
- Bulk download formats

### Ideal solution

### Model-specific Server

- Easy installation. Ready-to-use
  - npm install wwm

#### ■ Server fundamentals

- Built-in M3-M2-M1 directories
- XMI format (EMF-compliant) + fragment annotations
- Optional .nfo descriptors

#### ■ Model-specific URIs

- model://host:port/M3/M2/M1#fragment

#### ■ Extra commands

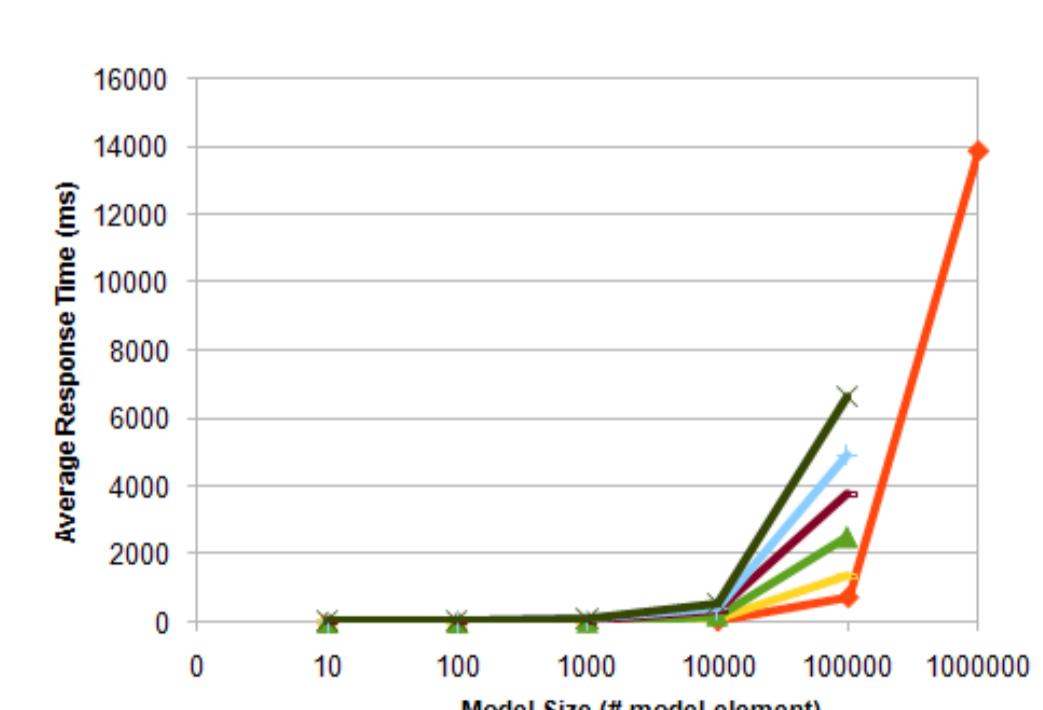

- ?list
- ?info

```
model://www.univ-pau.fr.ecore/bpmn/purchase  
model://www.univ-pau.fr.ecore/uml2#classDiagram  
model://www.univ-pau.fr.ecore?list  
...
```

### JS API Client

```
var wwm = require('wwm'); //import  
  
var client = wwm.createClient();  
  
//registering callbacks  
client.on('model', function (m) {  
    wwm.util.save(m);  
    console.log(m.name + ' downloaded');  
}).on('info', function (i) {  
    console.log(i);  
}).on('error', function (e) {  
    console.error(e);  
}).on('list', function (l) {  
    console.log(l.count + ' found');  
}).on('fragment', function (f) {  
    wwm.util.save(f);  
});  
  
//query example (ask for all ecore metamodels found)  
client.connect('model://www.univ-pau.fr.ecore?list');
```

### Benchmarks

► Load testing for model queries

Load testing for fragment queries ►
